

---

Radio-frequency filter, in particular in the form of a duplex filter

---

An improved radio-frequency filter is distinguished by the following features:

- the resonators (9, 19) are coupled to the continuous line (3) through a dielectric, preferably in the form of the board or of the substrate (1),
- at least a portion of the resonators (9, 19) is arranged such that, when viewed at right angles to the board or to the substrate (1), at least a portion of the resonator (9, 19) overlaps the continuous line (3), and
- in the area or section in which the continuous line (3) overlaps at least one section or one portion of the resonators (9, 19), the continuous line (3) has a line constriction (5a) or a broadened line area (5b), at least for one resonator (9, 19),
